

POLISH MARITIME TECHNOLOGY FORUM

DECLARATION – VISION of CO-OPERATION

Challenges to be met in the 21st century force the request for a new and far more broad approach towards the maritime industries. Conservative approach is a result of the traditional perception and clearly distinguish the three areas which namely are: the ship newbuilding, the ship repair and the supply chain. This seems not to be fully adequate nowadays.

The prime mover for the changes is a continuous development of technology, which creates new opportunities far more open for exploration of waters, seas and oceans resources. Technology development is an activator for the changes between entities vigorous within the maritime economy. It looks like the right response for the challenges of the future is a broad co-operation by number of diversified players, which complements each other and together gathers tremendous knowledge and skills un-available for those acting individually, even if belonging to an industrial group. Complementation and interfering of ideas, opinions, skills and tasks is inevitable, just the necessity.

There is nothing new in saying that process of continuous technology development will determine abilities for responding to the market needs and expectations also in the future.

This is why we are seeking common ground for communication, exchange of the ideas and co-operation which shall lead to synergetic effects to meet the 21st century challenges.

Polish Maritime Technology Forum constitutes of the entities,
who are courageously looking ahead and perceiving
21st century challenges as the new opportunities.

WE INVITE ALL WHO SHARE THE VISION

Jerzy Czuczman
CEO/Chairman
